---

## General Information

### Differentiating an Articulation, Phonology, and Childhood Apraxia of Speech

10

---

---

---

---

---

---

---

---

10

## Speech Sound Disorders

### Articulation

- Characterized by typically **predictable errors** that are usually developmental in nature.
- **Intelligibility** is mildly to moderately affected, based on the number of errors.
- Treatment is most successful is when it treats **individual phonemes**.

11

---

---

---

---

---

---

---

---

11

## Speech Sound Disorders

### Phonology

- Characterized by **patterns** of speech sound disorders.
- **Intelligibility** is moderately to severely affected with multiple sounds affected.
- Treatment is most successful when it **treats patterns** of errors rather than specific speech sounds.

12

---

---

---

---

---

---

---

---

12

## Speech Sound Disorders Childhood Apraxia of Speech

- The three speech characteristics **most useful** in differentiating a child with CAS from other children with severe speech sound disorders without CAS:
  - **Inconsistent errors** on consonants and vowels in repeated productions of syllables, words, and phrases.
  - **Vowel** deviations
  - **Prosodic** differences (intonation, stress, loudness). Coarticulation is affected by unusual transitions between between sounds and syllables.

These 3 are considered DIFFERENTIALLY DIAGNOSTIC.

All 3 characteristics (triad) do not need to be present to make a diagnosis of CAS since it **not a syndrome**. It is a **symptom cluster**, meaning that they are **related**.

13

13

---

---

---

---

---

---

---

---

---

---

## Speech Sound Disorders Childhood Apraxia of Speech

- Other commonly reported clinical signs of CAS include:
  - Phoneme sequencing
  - Groping for sounds
  - Drooling
  - Limited consonants and vowels in the phonetic repertoire
    - May be difficult to diagnosis definitively
    - Trial therapy may be required to confirm a CAS diagnosis
  - Difficulty imitating oral (nonspeech) movements
  - Difficulty imitating sounds and words
- These speech behaviors are not differentially diagnostic because children with other diagnoses may exhibit them.

14

14

---

---

---

---

---

---

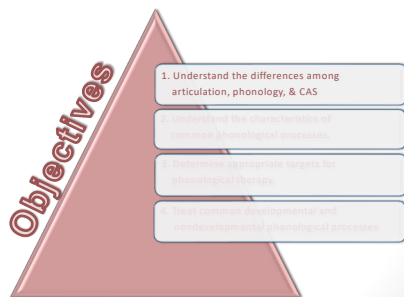

---

## Articulation Treatment

### How to Know When to Move Forward in Therapy

17

17

---

---

---

---

---

---

---

---

## Articulation Treatment

### Collecting Data

- Data collected on every response.
- Determine when to move to next step.
  - 80% accuracy
  - 20 consecutive correct responses
- You can still use 80% accuracy on the IEP.
- Use circles and diagonals to mark data.
- Let child see data sheet.

18

18

---

---

---

---

---

---

---

---

Child: \_\_\_\_\_ Phoneme/Goal: \_\_\_\_\_

**Key:** X = Correct with social and token reinforcement; / = Correct with social reinforcement only; O = Incorrect  
**Recommended Artic Reinforcement Schedule:** Isolation & Syllables - 100% social & 100% token; Words, Phrases, Sentences - 100% social & 50% token reinforcement; Conversation - 50% social & 10% token.

Date	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

19

Child: Johnny Example One Phoneme/Goal: \_\_\_\_\_

**Key:** X = Correct with social and token reinforcement; / = Correct with social reinforcement only; O = Incorrect  
**Recommended Artic Reinforcement Schedule:** Isolation & Syllables - 100% social & 100% token; Words, Phrases, Sentences - 100% social & 50% token reinforcement; Conversation - 50% social & 10% token.

Date	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	
Step A:																					
B:																					
B:																					
B:																					
B:																					
B:																					
B:																					

- A = isolation; B = syllables    1 = initial    2 = final    3 = medial
- Johnny met criterion in isolation and in the initial and final positions of syllables. [Note: Isolation = 81%; Initial syllables = 79%].
- In the medial position of syllables, Johnny achieved three consecutive correct responses at his best.

---

---

---

---

---

---

---

---

20

Child: Sally Example Two Phoneme/Goal: \_\_\_\_\_

**Key:** X = Correct with social and token reinforcement; / = Correct with social reinforcement only; O = Incorrect  
**Recommended Artic Reinforcement Schedule:** Isolation & Syllables - 100% social & 100% token; Words, Phrases, Sentences - 100% social & 50% token reinforcement; Conversation - 50% social & 10% token.

Date	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	
Step C:																					
D:																					
D:																					
D:																					
D:																					
D:																					
D:																					

- C = words; D = phrases; E = sent.    1 = initial    2 = final    3 = medial
- Sally met criterion in final position of single words in a picture naming task. [Note that percentage of accuracy = 73%].
- In the medial position of single words, Sally achieved 12 consecutive responses at her best (see bottom row).

---

---

---

21

## Articulation Treatment Managing Group Therapy

22

22

---

---

---

---

---

---

---

---

## Articulation Treatment Managing Group Therapy

- Most SLPs use **games** to occupy a child's attention in a group setting or reward the kids for doing well.
- The result is very few responses.

23

23

---

---

---

---

---

---

---

---

## Articulation Treatment Managing Group Therapy

- CHALLENGE: **Work in random order.**
- Get no more than 3 responses from one child before moving to the next.
- **Kids** stay alert and motivated.
- **SLPs** stay alert and motivated.

24

24

---

---

---

---

---

---

---

---

## Articulation Treatment

### Managing Group Therapy

- If the session is getting stale or kids are getting bored, change activities.
- Replace games with strong social reinforcement.
- Great reinforcers include *Chipper Chat*, *Token Towers*, stickers, and stamps.

25

## Articulation Treatment Correcting the /r/

28

---

---

---

---

---

---

---

---

28

## Articulation Treatment Correcting the /r/ - Stability Zones

The key to establishing the /r/ is teach the child to establish the **stability zones**.

This is where the posterior lateral margins of the tongue make contact with the upper molars.

If the stability zones are not maintained, the /r/ will never be produced correctly.

29

---

---

---

---

---

---

---

---

29

## Articulation Treatment Correcting the /r/ - Stability Zones

To help the child understand the stability zones, use your **index fingers** to touch the child's cheeks where the upper molars are.

Tell the child to make sure the sides of the tongue touch his back teeth where you are touching.

30

---

---

---

---

---

---

---

---

30

### Articulation Treatment

#### Correcting the /r/ - Stability Zones

1. Close front teeth.
2. **Bite down on the posterior lateral margins** AT THE SAME TIME.
3. Relax. Repeat.
4. Now **open the front teeth about 1/8"**.
5. Make sure upper molars are still pressing on the lateral margins.

31

31

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Teaching the consonantal /r/

1. With the stability zones intact, slightly **lower the jaw** a small amount.
2. Have child **point the tongue tip behind him**, lifting it up and back so you can see under the tongue.
3. Practice this **without speech** until the child can create this movement repeatedly.

32

32

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Teaching the consonantal /r/

4. Now add speech. Have child say "rah." Move from the stability zones to the /a/ by simply unrolling the tongue. Remind him not drop the tongue until **after** the /r/ is produced.
5. After /ra/ is consistent, continue with CV syllables and follow the normal progression to words & phrases.

33

33

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Teaching the consonantal /r/

The child must do all three movements correctly before the /r/ can be produced correctly:

- ❖ Bite lateral margins
- ❖ Open teeth slightly
- ❖ Curl tongue tip back

34

34

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Teaching the vocalic /r/

1. For the vocalic /r/, the tongue starts out on the floor of the mouth for the production of /a/.
2. Then lift the lateral margins up to the stability zones and lift the tongue tip up and back. Notice that this is the **reverse order** that was used for the consonantal /r/.

35

35

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Teaching the vocalic /r/

3. When producing /aɜ/ (as in *car*), have the child say /a/ and then glide into the /ɜ/. Stretch the /a/ if necessary.

Show the child how you make the the sound.

36

36

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Teaching the vocalic /r/

- You try it. Say /ɑ/ and then /ɜ/ and notice how the posterior tongue moves up and the lateral margins touch the molars. You can feel when the **stability zones are intact**.
- Now go from /ɜ/ to /ɑ/ and notice how the tongue falls and you **lose contact** with the stability zones.

37

37

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Teaching the vocalic /r/

4. If child says /ɔ/ or /ɑ/ instead of /ɑɜ/, let him know that the back of the tongue fell down. → **Don't be tricked by rising inflection.**
5. Touch the cheeks again to remind him where the tongue dorsum should go.

See HANDOUT:  
• Technique for Correction of /r/.

38

38

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Teaching the consonantal or vocalic /r/

So, what do you do when your student learning /r/ starts making it nasal?

39

39

---

---

---

---

---

---

---

---

## Oral and Nasal Listener

Ann Kummer, Ph.D.,

---

## Articulation Treatment Shaping Approach to Correcting the Frontal or Lateral Lisp

42

42

---

---

---

---

---

---

---

---

### Articulation Treatment Shaping Approach to Treating the Lisp

- Tongue tip UP.
- Tongue tip DOWN.

43

43

---

---

---

---

---

---

---

---

### Articulation Treatment Shaping Approach to Treating the Lisp

- Tongue tip UP should be the first approach to consider.
- Shape the /s/ from the /t/.

44

44

---

---

---

---

---

---

---

---

### Articulation Treatment Shaping Approach to Treating the Lisp

- |                          |            |
|--------------------------|------------|
| • [t]                    | • [tsssss] |
| • [t <sup>h</sup> ]      | • [tsssss] |
| • [t <sup>hh</sup> ]     | • [tssss]  |
| • [t <sup>hhh</sup> ]    | • [tsss]   |
| • [t <sup>hhhh</sup> ]   | • [tss]    |
| • [t <sup>hhhhh</sup> ]  | • [ts]     |
| • [t <sup>hhhhhh</sup> ] | • [s]      |
- Noisy T* (with arrow pointing to [t<sup>hhhhh</sup>])
- Squeaky T* (with arrow pointing to [tsssss])

See **HANDOUT:**  
• Shaping Procedure for the Lateral and Frontal Lisp

45

45

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Shaping Approach to Treating the Lisp

- Use this method of teaching tongue tip UP does not work.
- Smile to get lip spreading. The tongue will flatten naturally.
- Lips should have NO tension.
- Do **NOT** allow the tongue blade to elevate.

46

---

---

---

---

---

---

---

---

46

### Articulation Treatment

#### Shaping Approach to Treating the Lisp

1. Instruct the child to say /t/ several times so he becomes familiar with the movement pattern. Use a **straw** to amplify the sound. McDonalds or Panera straw
2. Ask the child to “blow more air” through the /t/ in order to produce a long or “stretchy” (aspirated) /t/.

47

---

---

---

---

---

---

---

---

47

### Articulation Treatment

#### Shaping Approach to Treating the Lisp

3. Rehearse the /t<sup>h</sup>/ constantly.
4. Begin to shape the /t<sup>h</sup>/ into /ts/.
5. **Do NOT** ask the child to produce /ts/.
6. A good /ts/ will result if the child focuses on the oral position for /t/.
7. If not successful, try switching to /tʃ/.

48

---

---

---

---

---

---

---

---

48

Articulation Treatment  
Shaping Approach to Treating the Lisp

IMPORTANT RULE

The Stretchy /t/ will only work if the child can produce a /t/ correctly.

49

49

---

---

---

---

---

---

---

---

Articulation Treatment  
Shaping Approach to Treating the Lisp

SUCCESS VS. FAILURE

1. The tongue should be positioned behind the anterior teeth at the **papilla**.
2. The airstream should be midline.

Both of these characteristics must be noted for the production to be considered correct.

50

50

---

---

---

---

---

---

---

---

Articulation Treatment  
Shaping Approach to Treating the Lisp

Be aware that the Stretchy /t/ does not work for all kids. Use the following **guidelines** to make decisions about changing directions:

51

51

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Shaping Approach to Treating the Lisp

- If your child with either the frontal or lateral lisp **CAN** produce a /ts/ or /tʃ/ correctly by using the Stretchy /t/ approach, he is **ready to move on** to the Key Sound level.
- The Target Sound is the /ts/, followed by Words, Phrases, Sentences, etc.

52

52

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Shaping Approach to Treating the Lisp

- If he **CANNOT** produce the /ts/ or /tʃ/ correctly using the Stretchy /t/ without resorting to the frontal or lateral lisp, then you will need to **change techniques**.

53

53

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Shaping Approach to Treating the Lisp

- If he **CAN** produce a good /t/ or /tʃ/ production at any point, but **CANNOT maintain** the production, then he is **NOT ready to move on** to the establishment of /ts/ as the target sound.
- Just stay at the /t/ level until he achieves more success.

54

54

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Shaping Approach to Treating the Lisp

- If he **PROTRUDES THE TONGUE** during production of /t/, and if he also does so on /d/, /n/, and /l/, then this is a clear indication of a **more pervasive oral-motor delay**.
- Jaw instability and low tone should be suspected.

55

55

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Avoiding Common Pitfalls

56

56

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Correcting production of /f/

- In normal conversational speech, the lower teeth just touch the inside surface of the lower lip. The upper teeth do not **bite** lower lip.
- Encourage the child to just touch the lower lip to the upper teeth.

57

57

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Correcting production of /θ/

- The /θ/ is just a **tongue sound**. A child who has been producing the f/θ error is likely to use the lower lip with the tongue.
- Be careful not to allow **lower lip assist**. It is not a normal production and it will slow the diadochokinetic rates during connected speech.

58

58

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Correcting production of alveolars

- As we just discussed with the frontal lisp, the child should never be told to put the tongue right behind the teeth. The tongue should be at the **papilla**, or “the spot.”
- This reduces the chances of the child developing a **therapy-induced intradental lisp**.

59

59

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Working at the phrase level

- If a child produces a target word after a **pause**, the result is production at the word level, not the phrase level.
- The pause typically occurs because the child is concentrating so hard on the target sound that he ends up pausing, so continuous speech is needed.

60

60

---

---

---

---

---

---

---

---

### Articulation Treatment

#### Working at the phrase level

- **Example:** Billy is working on initial /k/ in phrases. He says, *Paul **u** can run.*
- This response should not be counted as correct because Billy produced /k/ correctly, but it wasn't in a phrase. It was simply a production of a single word.

61

---

---

---

---

---

---

---

---

61

### Articulation Treatment

#### Working with closed teeth

- When teaching sounds that require mandibular closure, don't just instruct the child to "*close your teeth,*" tell him to "*close your **front** teeth.*"
- This will reduce the chance that the child will **clench** his teeth.
- Look/feel for contraction of the **masseter** muscle.

62

---

---

---

---

---

---

---

---

62

# Phonology

63

---

---

---

---

---

---

---

---

63

# Phonological Assessment

## Common Phonological Processes

64

64

---

---

---

---

---

---

---

---

---

---

### *Common Phonological Processes*

1. Prevocalic Voicing
2. Postvocalic Devoicing
3. Final Consonant Deletion
4. Velar Fronting
5. Palatal Fronting
6. Consonant Harmony (Assimilation)
7. Weak Syllable Deletion
8. Cluster Reduction (Simplification)
9. Gliding of Liquids
10. Stopping and Stridency Deletion

65

65

---

---

---

---

---

---

---

---

---

---

### *Common Processes*

#### Prevocalic Voicing [PVV] [IV]

- A word-initial voiceless consonant is replaced by a voiced consonant.
- Most commonly occurs on plosives. PVV rarely occurs on other phonemes.

• • • • •

- /kʌp/ (cup) → /gʌp/

66

66

---

---

---

---

---

---

---

---

---

---

### Common Processes

#### Postvocalic Devoicing [PVD] [FD]

- A word-final voiced consonant is replaced by a voiceless consonant.
- This usually occurs on plosives, but can occur on affricates.
- Very rare on fricatives.
- CAUTION:** When PVD is produced by AA children, it is considered dialectal and should not be targeted.
- \* \* \* \* \*
- /rɛd/ (red) → /rɛt/

67

67

---

---

---

---

---

---

---

---

### Common Processes

#### Final Consonant Deletion (FCD)

- A final consonant (or entire cluster) is omitted from the word.
- This is one of the most common phonological processes observed in children.
- \* \* \* \* \*
- /dɒg/ (dog) → /dɔ/
- /bʌs/ (bus) → /bʌ/
- /mæsk/ (mask) → /mæ/

68

68

---

---

---

---

---

---

---

---

### Common Processes

#### Velar Fronting (VF)

- A velar phoneme /k/ or /g/ is replaced by an alveolar.
- It is **not** VF if a velars to a palatal. /bæk/ → /bæʃ/
- When /ŋ/ is replaced by final /n/, as in /tɔkɪŋ/ (talking) becoming /tɔkɪn/, it is usually regional and is not targeted in therapy.
- \* \* \* \* \*
- /kɒm/ (comb) → /tɒm/
- /ɡes/ (guess) → /dɛt/
- /bæk/ (back) → /bæʃ/

69

69

---

---

---

---

---

---

---

---

### Common Processes

#### Palatal Fronting (PF)

- A palatal phoneme /j/, /ʒ/, /tʃ/, /dʒ/ is replaced by an alveolar.

.....

- /ʃu/ (shoe) → /su/ or /tu/
- /dʒʌmp/ (jump) → /dʌmp/
- /tʃeɪn/ (chain) → /teɪn/
- /bætʃ/ (batch) → /bæʔ/

70

70

---

---

---

---

---

---

---

---

---

---

### Common Processes

#### Consonant Harmony [CH] (Assimilation)

- One phoneme is influenced by another.
- The harmony can be determined by **direction** (progressive or regressive) or **place of articulation** (labial, alveolar, alveolar).
- Determine if you are observing FR, BK, or CH

.....

- /tɔk/ (talk) → /tɔt/ Progressive alveolar assim.
- /kɑɪt/ (kite) → /tɑɪt/ Regressive alveolar assim.
- /kɒp/ (cop) → /pɒp/ /mɒp/ Regressive Labial assim.

71

71

---

---

---

---

---

---

---

---

---

---

### Common Processes

#### Consonant Harmony [CH] (Assimilation)

- Differentiate **FRONTING** or **BACKING** from **ASSIMILATION** by examining velars & alveolars to determine a pattern.

.....

- /kɑr/ (car) → /tɑ/ VF
- /tʃeər/ (chair) → /tʃe/ PF
- /tæp/ (tap) → /kæp/ BK

Notice how Fronting & Backing occur in **isolation** since there is no phoneme influencing another.  
**This child is NOT exhibiting CH.**

72

72

---

---

---

---

---

---

---

---

---

---

### Common Processes

#### Consonant Harmony [CH] (Assimilation)

- CH can be examined if there are phonemes that can influence others.

.....

- Cat produced as [tæt]      Final /t/ influences /k/      RA
- Cup produced as [kʌk]      Initial /k/ influences /p/      PA
- Suit produced as [tut]      Final /t/ influences /s/      RA

Here the Fronting and Backing **do not** occur in isolation, but **only** in the environment of another consonant.

This child IS exhibiting CH.

73

73

---

---

---

---

---

---

---

---

---

---

### Common Processes

#### Weak Syllable Deletion [WSD] [USD]

- A weak or unstressed syllable is deleted.
- This only applies to words with more than one syllable.

.....

- /ɹlɒn/ (alone)      → /wɒn/      /ɹ/ deleted
- /tɛləfɒn/ (telephone)      → /tɛfɒn/      /lə/ deleted

74

74

---

---

---

---

---

---

---

---

---

---

### Common Processes

#### Cluster Reduction [CR] [CS]

- A consonant cluster is reduced by at least one element.

.....

- /stɛp/ (step)      → /sɛp/ or /tɛp/
- /splæʃ/ (splash)      → /plæʃ/ or /pæʃ/
- /slɪp/ (sleep)      → /ɪp/ is ICD, not CR

75

75

---

---

---

---

---

---

---

---

---

---

### Common Processes

#### Liquid Simplification

##### Gliding of Liquids [GL]

- Liquids are replaced by glides.

.....

- /læmp/ (lamp) → /wæmp/ or /jæmp/
- /rʌn/ (run) → /wʌn/

76

76

---

---

---

---

---

---

---

---

### Common Processes

#### Liquid Simplification

##### Vocalization [VOC] or Vowelization [VOW]

- A word-final liquid is **replaced** by a **vowel**.

.....

- /kɑr/ (car) → /kɑ/
- /brʌðə/ (brother) → /brʌdʊ/
- /æpl/ (apple) → /æpʊ/

77

77

---

---

---

---

---

---

---

---

### Common Processes

#### Liquid Simplification

##### Vocalization [VOC] or Vowelization [VOW]

- If the final liquid is **omitted** and is NOT replaced by a new vowel, it is **FCD**.

.....

- /bɔ/ (ball) → /bɔ/
- /kɑr/ (car) → /kɑ/

These are FCD (not VOC) because the original vowel was maintained.

78

78

---

---

---

---

---

---

---

---

### Common Processes

#### Stopping [ST] & Stridency Deletion [STR]

##### STOPPING

- A fricative or affricate is replaced by a **plosive**.

.....

- /sʌn/ (sun) → /tʌn/
- /tʃɔk/ (chalk) → /tɔk/; /kɔk/

##### STRIDENCY DELETION

- A fricative or affricate is replaced by a **plosive**...

- ... or /θ/ or /ð/.
- ... or is **omitted**.

.....

- /sʌn/ (sun) → /tʌn/
- /sʌn/ (sun) → /θʌn/
- /sʌn/ (sun) → /ʌn/

---

---

---

---

---

---

---

---

---

---

79

### Common Processes

#### Nondevelopmental Processes

##### ➤ Initial Consonant Deletion [ICD]

- /læmp/ (lamp) → /æmp/

##### ➤ Backing [BK]

- /tɑɜ/ (tar) → /kɑɜ/

Already discussed when differentiating FR and BK from Consonant Harmony.

##### ➤ Glottal Replacement [GR]

- /wægn/ (wagon) → wæʔn
- /mesi/ (messy) → mɛʔi

---

---

---

---

---

---

---

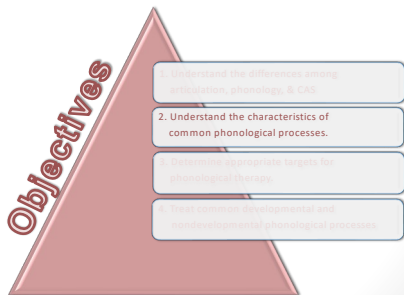

---

---

---

80

### Learner Outcomes

---

---

---

---

---

---

---

---

---

---

81

## Phonological Assessment Determining Need for Therapy

82

82

---

---

---

---

---

---

---

---

## Phonological Assessment Determining Need for Therapy

- A child should qualify for therapy for speech sound disorders based on three criteria:
  - 1.5 standard deviations below the mean
  - Overall intelligibility
  - Documented adverse effect
- A child may qualify if scores are above 1.5 standard deviations if you can document:
  - Adverse effect
  - Sufficient unintelligibility

83

83

---

---

---

---

---

---

---

---

## Phonological Assessment Determining Need for Therapy

- Keep in mind that nondevelopmental processes are not counted in the normative data.
- If a nondevelopmental process occurs five or more times, it is significant and may help you make a decision about eligibility.

84

84

---

---

---

---

---

---

---

---

### Phonological Assessment Determining Need for Therapy

- A child qualifies for services whether the dx is Artic, Phono, or CAS
- Use ICD 10 Code: F80.1 for all.
- **Articulation** or **phonology** only pertains to materials, & methods,
- A severe phonological child may later be treated as artic, as he improves and the eligibility category won't change.

85

85

---

---

---

---

---

---

---

---

### Phonological Assessment Determining Targets for Therapy

86

86

---

---

---

---

---

---

---

---

### Phonological Assessment Determining Targets for Therapy

- Phonological treatment should always start with nondevelopmental process.
  - Initial Consonant Deletion
  - Backing
  - Glottal Replacement
- We start here for two reasons:
  - Typically-developing children don't produce these processes and they **don't self-correct** easily.
  - **Intelligibility** is significantly impaired.

87

87

---

---

---

---

---

---

---

---

## Phonological Assessment Determining Targets for Therapy

- Initial Consonant Deletion
  - Most meaning in the initial consonants
  - FCD does not impair intelligibility as badly.
- Backing
  - All alveolars and palatals are reduced to /k/ & /g/.
  - With the majority of phonemes being backed, intelligibility is reduced significantly.
- Glottal Replacement
  - Affects plosives, fricatives, and affricates.
  - All may be reduced to a glottal stop.

88

88

---

---

---

---

---

---

---

---

## Phonological Assessment Determining Targets for Therapy

- If there are no nondevelopmental processes that are productive (occurs 5+ times), the priority should be placed on the earliest suppressing processes.
  - Weak Syllable Deletion
  - Prevocalic Voicing
  - Final Consonant Deletion
  - Velar Fronting
  - Stopping/Stridency Deletion

89

89

---

---

---

---

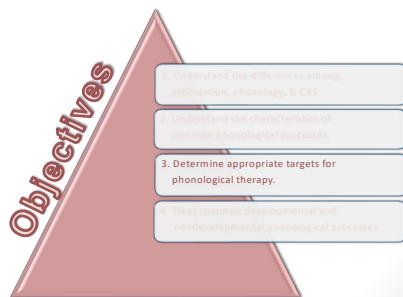

---

---

---

---

## Learner Outcomes

90

---

---

---

---

---

---

---

---

# Phonological Treatment

## Treating Nondevelopmental Phonological Processes

91

91

---

---

---

---

---

---

---

---

### *Nondevelopmental Processes*

1. Initial Consonant Deletion
2. Backing
3. Glottal Replacement

92

92

---

---

---

---

---

---

---

---

### Initial Consonant Deletion

93

93

---

---

---

---

---

---

---

---

### Phonological Treatment

#### Initial Consonant Deletion [ICD]

- Help the child hear the difference between words with initial consonants and those without initial consonants.
- Remember to start with a recognition task before production.

94

---

---

---

---

---

---

---

---

94

### Phonological Treatment

#### Initial Consonant Deletion [ICD]

##### Minimal Oppositions → Minimal pairs

- | <u>Error</u> | <u>Target</u> | <u>Target</u> | <u>Target</u> |
|--------------|---------------|---------------|---------------|
| • eight      | wait          |               |               |
| • itch       | witch         |               |               |

##### Maximal Oppositions

- |        |       |       |       |
|--------|-------|-------|-------|
| • eat  | meat  | seat  |       |
| • in   | pin   | chin  |       |
| • at   | cat   | sat   | chat  |
| • each | peach | reach | teach |

95

---

---

---

---

---

---

---

---

95

### Phonological Treatment

#### Initial Consonant Deletion [ICD]

- Come up with as many minimal pairs as you can and make picture cards for each. There may be some available commercially.
- Place a minimal pair in front of the child and have him put a token over the word you say.
- Exaggerate final consonant at first.

96

---

---

---

---

---

---

---

---

96

### Phonological Treatment Initial Consonant Deletion [ICD]

- Come up with as many minimal pairs as you can.
- Place a minimal pair in front of the child and have him put a token over the word you say.
- Exaggerate initial consonant at first.
- Then move to production of single words.

97

97

---

---

---

---

---

---

---

---

### Phonological Treatment Initial Consonant Deletion [ICD]

- in pin
- SLP → Put a token in the cup under picture of pin.
- SLP → Where do you want me to look for the circle?
- Child → IN
- SLP → OK, I'll look under "in." It's not under "in."
- SLP → Where else should I look?
- Child → IN
- SLP → It's not under "in." Do you mean "Pin?"
- SLP → Help child say word again.
- SLP → Try it again. Where should I look for the circle?
- Child → PIN
- SLP → Let's see. There it is! Great job putting the sound at the beginning of the word.

98

98

---

---

---

---

---

---

---

---

### Phonological Treatment Initial Consonant Deletion [ICD]

- When the child is consistent with single word production, move to production of the target word in short sentences.
- Use the minimal pair cards to have the child produce two sentences with carrier phrases.

99

99

---

---

---

---

---

---

---

---

### Phonological Treatment Initial Consonant Deletion [ICD]

- I see eight.      I see gate.
- I see age.        I see cage.
- I see all.         I see fall
- I see up.         I see cup.
- I want at.        I want mat.
- I want ice.       I want mice.
- I want eel.       I want seal.
- I want oil.       I want soil.

100

---

---

---

---

---

---

---

---

100

### Backing

101

---

---

---

---

---

---

---

---

101

### Phonological Treatment Backing [BK]

- As stated earlier, all alveolars and palatals are reduced to /k/ & /g/, so intelligibility is impaired dramatically.
- Since /t/ and /d/ will correct this process, treating BK as artic only will work well.

102

---

---

---

---

---

---

---

---

102

# Glottal Replacement

103

103

---

---

---

---

---

---

---

---

## Phonological Treatment

Glottal Replacement [GR]

- Unlike ICD and BK, *Glottal Replacement* is insertion of a **non-standard English sound**, making its impact on intelligibility significant.

104

104

---

---

---

---

---

---

---

---

Example:  
*Glottal Replacement*  
 occurs on /k/

105

105

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /k/ Example

Fully Whispered /a/

[<sup>hhhhh</sup>aaaaa]

106

106

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /k/ Example

Fully Whispered /a/ with  
overlaid velar

[<sup>hhhhh</sup>aa<sup>k</sup><sup>hhhhh</sup>aaaaa]

107

107

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /k/ Example

Voicing introduced *after*  
vowel onset.

[<sup>hhhhh</sup>aa<sup>k</sup><sup>hhhhh</sup>aaaaa]

108

108

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /k/ Example

Voicing introduced *at*  
vowel onset.

[hhhhh<sup>a</sup>aa<sup>k</sup>hhhhh<sup>a</sup>aaaaa]

109

109

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /k/ Example

Aspiration decreased following  
/k/

[hhhhh<sup>a</sup>aa<sup>k</sup>hh<sup>a</sup>aaaaa]

110

110

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /k/ Example

Normal duration of /k/ release  
for medial position

[hhhhh<sup>a</sup>aa<sup>k</sup>h<sup>a</sup>aaaaa]

111

111

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /k/ Example

Normal duration of /k/ release  
for medial position

[<sup>h</sup>hhhhh<sup>a</sup>aa<sup>k</sup>h<sup>a</sup>]

(blue = normal syllable)

112

112

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /k/ Example

Decreased duration of  
carrier aspiration

[<sup>h</sup>h<sup>a</sup>k<sup>h</sup>a]

113

113

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /k/ Example

Normal /k/ production in the  
initial position

[<sup>k</sup>h<sup>a</sup>]

114

114

---

---

---

---

---

---

---

---

Example:  
Glottal Replacement  
occurs on /s/

115

115

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /s/ Example

Fully Whispered /a/

[ hhhhhh aaaaaa ]

116

116

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /s/ Example

Fully Whispered /a/ with  
overlaid velar

[ hhhhhh aaas hhhhhh aaaaaa ]

Unlike correcting the /k/, which needs aspiration since it is a plosive, the /s/ is already a continuant, so we are simply forcing breathiness. This is not considered aspiration since the target sound is already strident.

117

117

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /s/ Example

Voicing introduced *after*  
vowel onset.

[ hhhhhh aas hhhhhh aaaaaa ]

118

118

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /s/ Example

Voicing introduced *at*  
vowel onset.

[ hhhhhh aas hhhhhh aaaaaa ]

119

119

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /s/ Example

Aspiration decreased following  
*/s/*

[ hhhhhh aas hhh aaaaaa ]

120

120

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /s/ Example

Normal duration of /s/ release  
for medial position

[<sup>hhhhh</sup>aasaaaaa]

121

121

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /s/ Example

Normal duration of /s/ release  
for medial position

[<sup>hhhhh</sup>aasa]

(purple= normal syllable)

122

122

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /s/ Example

Decreased duration of  
carrier aspiration

[<sup>hh</sup>asa]

123

123

---

---

---

---

---

---

---

---

Phonological Treatment  
Glottal Replacement [GR] - /s/ Example

Normal /s/ production in the  
initial position

[sa]

See HANDOUT:  
• Treating Glottal Replacement

124

124

---

---

---

---

---

---

---

---

---

---

Phonological Treatment  
Treating Common  
Developmental Phonological  
Processes

125

125

---

---

---

---

---

---

---

---

---

---

Common Phonological Processes

1. Prevocalic Voicing
2. Postvocalic Devoicing
3. Final Consonant Deletion
4. Velar Fronting
5. Palatal Fronting
6. Consonant Harmony (Assimilation)
7. Weak Syllable Deletion
8. Cluster Reduction (Simplification)
9. Gliding of Liquids
10. Stopping and Stridency Deletion

126

126

---

---

---

---

---

---

---

---

---

---

**Prevocalic Voicing**  
**Initial Voicing**

127

127

---

---

---

---

---

---

---

---

**Phonological Treatment**  
Prevocalic Voicing [PVV] [IV]

- PVV is an early-suppressing process (3 yrs. of age) and should be targeted early if it is still productive (30% usage).
- Before working on production, the child needs to hear the difference between words with initial voiced and voiceless consonants with minimal pairs.
- Recognition task, not production!

128

128

---

---

---

---

---

---

---

---

**Phonological Treatment**  
Prevocalic Voicing [PVV] [IV]

<u>Error</u>	<u>Target</u>	<u>Error</u>	<u>Target</u>
• bore	pour	beach	peach
• dip	tip	door	tore
• girl	curl	goat	coat
• van	fan	vat	fat

When the child can recognize the difference between these words, try implementing the **Intrusive /h/** before using Minimal Pairs.

See HANDOUT:  
• Intrusive /h/

129

129

---

---

---

---

---

---

---

---

### Phonological Treatment Prevocalic Voicing [PVV] [IV]

• **Intrusive /h/**. Child should turn on speech motor during transition.

- /p/ + ham = Pam      /p/ + hole = po/ə
- /t/ + hawk = talk      /t/ + hoe = toe
- /k/ + hat = cat      /k/ + home = comb
- /s/ + hand = sand      /s/ + hay = say
- /f/ + heat = feet      /f/ + harm = farm
- /ʃ/ + hot = shot      /ʃ/ + hair = share
- /θ/ + horn = thorn      /θ/ + hum = thumb
- /tʃ/ + hat = chat      /tʃ/ + hair = chair

Child says  
doe for toe.

/tʰhʰhʰho/

sssshhhay

130

130

---

---

---

---

---

---

---

---

### Postvocalic Devoicing Final Devoicing

131

131

---

---

---

---

---

---

---

---

### Phonological Treatment Postvocalic Devoicing [PVD]

- As with PVV above:
  - Early-suppressing
  - Help child hear the difference
  - Use minimal pairs in a recognition task only.

132

132

---

---

---

---

---

---

---

---

### Phonological Treatment

#### Postvocalic Devoicing [PVD]

<u>Error</u>	<u>Target</u>	<u>Error</u>	<u>Target</u>
• cup	cub	cop	cob
• beet	bead	pat	pad
• back	bag	pick	pig
• rice	rise	bus	buzz
• H	age	batch	badge

Remember: This phonological process should not be targeted if it is suspected that a dialectal difference accounts for the child's productions, such as AA.

133

133

---

---

---

---

---

---

---

---

---

---

### Phonological Treatment

#### Postvocalic Devoicing [PVD]

- When the child is consistent with the identification task, start production of single words.
- Use the token activity we discussed for PVV, placing the token in one cup.
- Place the two cards of a minimal pair on each of the cups.

134

134

---

---

---

---

---

---

---

---

---

---

### Phonological Treatment

#### Postvocalic Devoicing [PVD]

- cup      cub
- SLP → Put a token in the cup under picture of cub.
- SLP → *Where do you want me to look for the circle?*
- Child → CUP
- SLP → *OK, I'll look under "cup." It's not under "cup."*
- SLP → *Where else should I look?*
- Child → CUP
- SLP → *It's not under "cup." Do you mean "cuB?"* 
- SLP → Help child say word again.
- SLP → *Try it again. Where should I look for the circle?*
- Child → CUB
- SLP → *Let's see. There it is! Great job putting the sound at the end of the word.*

No schwa!

135

135

---

---

---

---

---

---

---

---

---

---

# Final Consonant Deletion

136

---

---

---

---

---

---

---

136

## Phonological Treatment Final Consonant Deletion [FCD]

- As with PVV & PVD above:
  - Early-suppressing
  - Help child hear the difference
  - Use minimal pairs in a recognition task only.

137

---

---

---

---

---

---

---

137

## Phonological Treatment Final Consonant Deletion [FCD]

### Minimal Oppositions

<u>Error</u>	<u>Target</u>	<u>Target</u>	<u>Target</u>
• bay	bait		
• bee	beak		

### Maximal Oppositions

• bow	boat	bone	
• so	soap	soak	
• cow	couch	cows	count
• my	mine	mice	might

138

---

---

---

---

---

---

---

138

### Phonological Treatment

#### Final Consonant Deletion [FCD]

- When the child is consistent with the identification task, start production of single words.
- Continue with the cup task that was described for Postvocalic Devoicing.

139

139

---

---

---

---

---

---

---

---

### Phonological Treatment

#### Final Consonant Deletion [FCD]

- **cow** **couch**
  - SLP → Put a token in the cup under picture of **couch**.
  - SLP → *Where do you want me to look for the circle?*
  - Child → **COW**
  - SLP → *OK, I'll look under "cow." Hmm, it's not there. Oh, you mean "cou**CH**"*

This activity can be expanded if you decide to use Multiple Oppositions.

140

140

---

---

---

---

---

---

---

---

### Phonological Treatment

#### Final Consonant Deletion [FCD]

- When the child is consistent with single word production, move to production of the target word in short sentences.
- Use the minimal pair cards to have the child produce two sentences with carrier phrases.

141

141

---

---

---

---

---

---

---

---

### Phonological Treatment Final Consonant Deletion [FCD]

- bay is here.      ba**k**e is here.
- bow is here.      bo**n**e is here.
  
- cow **on floor** .      cou**ch** on floor.
- sew **on floor**.      soap **on floor**.

Remember: Don't allow a **glottal stop** to replace a final consonant

142

142

---

---

---

---

---

---

---

---

### Velar Fronting

143

143

---

---

---

---

---

---

---

---

### Phonological Treatment Velar Fronting [VF]

- Elicit /k/ and add /h/-initial word.
  - /k/ + hall = call
  - /k/ + home = comb
  - /k/ + huff = cuff
- Gradually shorten aspiration until target is reached.
- Remember to implement the **Intrusive /h/ before** using Minimal Pairs.

When trying to elicit "call", the child will typically produce "tall" or "k-tall."

144

144

---

---

---

---

---

---

---

---

### Phonological Treatment

#### Velar Fronting [VF]

##### Minimal Oppositions

Error	Target	Target
• cab	tab	
• go	dough	

##### Maximal Oppositions

• care	tear	dare
• coat	tote	dote
• go	toe	dough

145

145

---

---

---

---

---

---

---

---

---

---

### Palatal Fronting

146

146

---

---

---

---

---

---

---

---

---

---

### Phonological Treatment

#### Palatal Fronting [PF]

- Elicit /tʃ/ and add /h/-initial word.
  - /tʃ/ + hat = chat
  - /tʃ/ + hair = chair
  - /tʃ/ + hum = chum
- Blend the /tʃ/ and /h/-initial word with aspiration of the /tʃ/ and slightly prolonged /h/.
- Gradually shorten aspiration until target is reached.

When trying to elicit "chat", this child will probably say produce "tat" or "ch-tat."

147

147

---

---

---

---

---

---

---

---

---

---

### Phonological Treatment

#### Palatal Fronting [PF]

##### Minimal Oppositions

Error	Target	Target
• chalk	talk	
• Jeep	deep	

##### Maximal Oppositions

• chip	tip	dip
• chime	time	dime
• Gym	Tim	dim

148

148

---

---

---

---

---

---

---

---

### Consonant Harmony Consonant Assimilation

149

149

---

---

---

---

---

---

---

---

### Phonological Treatment

#### Consonant Harmony [CH] (Assimilation)

- Once you have definitively identified Consonant Harmony (op. VF, PF, BK), the question then is **“Now what do I do?”**
- While this is considered a common process, **it is not one that is typically treated.**
- CH usually resolves once other processes have been remediated.

150

150

---

---

---

---

---

---

---

---

**Weak Syllable Deletion**  
**Unstressed Syllable Deletion**

151

151

---

---

---

---

---

---

---

---

**Phonological Treatment**  
**Weak Syllable Deletion [WSD] [USD]**

- **TROCHAIC STRESS:** A **stressed syllable** is **followed** by a weak syllable. **/U** [Trochees]
  - *Bunny* [bʌ]
  - *Mommy* [mɑ]
- **IAMBIC STRESS:** A **stressed syllable** is **preceded** by a weak syllable. **U /** [Iambs]
  - *Alone* [nɒn]
  - *Awake* [wek]

152

152

---

---

---

---

---

---

---

**Phonological Treatment**  
**Weak Syllable Deletion [WSD] [USD]**

- **SPONDAIC STRESS:** Both syllables are stressed. **U U** [Spondees]
  - *Football*
  - *Baseball*
  - *Mayday*
  - *Heartbreak*
  - *Doorway*
  - *Sunshine*
  - *Cowboy*
  - *Mushroom*

This is just for your information. We don't target spondees since there is no unstressed syllable.

2 other stress patterns appear in English, but are not appropriate to teach young children:

Dactylic /UU *alphabet*  
Anapestic UU/ *contradict*

153

153

---

---

---

---

---

---

---

---

### Phonological Treatment

#### Weak Syllable Deletion [WSD] [USD]

- WSD is one of the **earliest suppressing** processes (typically by age 3).
- Since it represents very immature speech development, it should be **targeted very early**.
- Stick with **bisyllabic targets** since very young children typically don't use 3-syllable words.

154

---

---

---

---

---

---

---

---

154

### Phonological Treatment

#### Weak Syllable Deletion [WSD] [USD]

- Start with target words that have **iambic stress** because they are easier to teach. [U /] *alone, awake*
- Your success comes from targeting words that **end with a stressed syllable**.
- Then move to target words with **Trochaic stress**. [/ U] *bunny, mommy*

155

---

---

---

---

---

---

---

155

### Cluster Reduction Cluster Simplification

156

---

---

---

---

---

---

---

---

156

### Phonological Treatment

#### Cluster Reduction [CR] [CS]

- The easiest way to target CR is by teaching /s/ clusters since /l/ and /r/ may not have developed yet.
- Start with easier clusters; then plosives.
  - /sm/, /sn/, /sw/      Notice continuous airflow
  - /sp/, /st/, /sk/

157

---

---

---

---

---

---

---

---

157

### Phonological Treatment

#### Cluster Reduction [CR] [CS]

- Teaching /l/ clusters can be a challenge. The idea is to produce two phonemes at the same time.
- If the cluster elements are taught separately, a schwa will usually be inserted, resulting in EPENTHESIS.
  - /bəlʊ/ for “blue”
  - /kəlæp/ for “clap”

158

---

---

---

---

---

---

---

---

158

### Phonological Treatment

#### Cluster Reduction [CR] [CS]

- The tongue tip should start out with the placement for the /l/.
- The tongue stays at the papilla when producing the 1<sup>st</sup> element of the cluster.

159

---

---

---

---

---

---

---

---

159

### Phonological Treatment

#### Cluster Reduction [CR] [CS]

- The /k/, /p/, and /f/ (and the cognates) are all produced with the tongue already in place.
- The /s/ cluster should be delayed until the child can produce the other /l/ clusters. This is classified as an /s/ cluster, not an /l/ cluster because of the tongue is elevated after the /s/.

160

160

---

---

---

---

---

---

---

---

### Phonological Treatment

#### Cluster Reduction [CR] [CS]

- There must be significant mandibular opening or the /l/ will likely be deleted.
- The mandibular opening is encouraged by the use of low vowels /æ/ and /ɑ/.

See HANDOUT:  
• Vowel Quadrilateral

### Gliding of Liquids

162

162

---

---

---

---

---

---

---

---

### Phonological Treatment

#### Gliding of Liquids [GL]

- GL is often just **treated as artic** since the only two phonemes that need to be targeted are /l/ and /r/.
- **Correction of /r/** was discussed earlier in the Articulation Treatment section, so it will not be addressed here.

163

163

---

---

---

---

---

---

---

---

### Phonological Treatment

#### Gliding of Liquids [GL]

- **Initial /l/** should be taught with a very light touch of the tongue.
- The mandible should be somewhat open, but **naturally**. Even when pairing /l/ with a low vowel, the jaw **should never be lower than a relaxed /a/**.
- Do not allow the tongue to protrude beyond the teeth.

164

164

---

---

---

---

---

---

---

---

### Phonological Treatment

#### Gliding of Liquids [GL]

- After the initial /l/ is consistent, move to the **medial position**.
- **Avoid the final /l/**, as it is often omitted as part of regional or colloquial speech. The final /l/ is extremely difficult to teach and it usually comes is spontaneously after the initial and medial positions are learned.

## Stopping Stridency Deletion

166

166

---

---

---

---

---

---

---

---

## Phonological Treatment Stopping [ST]; Stridency Deletion [STR]

- Typical situation
    - SLP → Say “sun.”
    - Child → “tun”
  - SLP → Say /ssssss/
  - Child → /ssssss/
  - SLP → Great. Now say “sssssssun.”
  - Child → “sssssstun”
- Start with what the child has in is repertoire: /s/ clusters.

167

167

---

---

---

---

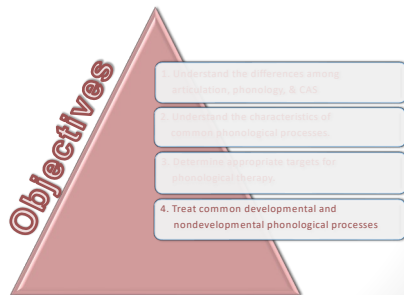

---

---

---

---
